

# TEFOND PRO

Tefond Pro represents the complete solution to **protect and insulate underground walls**: infact it has an insulating component as TEGOTHERM XPS and a drainage component, 10 mm thick and a special drainage geotextile. All the above made as one product only, easy and quick to install for a real insulation of the underground walls.

Tefond Pro allows you to:

- **THERMAL INSULATE** the basement areas;
- **DRAIN THE RAINWATER** avoiding that this can come in contact with the underground walls.
- **CREATE AERATION** between the insulating panel and the underground wall so as to allow them a breathability also from the outer surface.

Tefond Pro has been studied having the right dimensions to protect and insulate the whole height of the underground wall with one panel only, without having horizontal junctions: installation is quick and simple, and the finished work is technically perfect. It also has a system to protect the drainage pipe from possible soil infiltrations.
